

Super Admin guide

You run the system: you add and remove admins, keep everything working, and can open any region to help it.

Website: gnatashanti.rootabytes.com/admin

1 Set up your account

Sign in with the email and temporary password set on the server. Add your phone number and choose your own password.

2 Add an admin

Admins > Add admin: their name, WhatsApp number and region. The system makes a temporary password.

3 Send their sign-in

Tap WhatsApp or SMS to send the sign-in link, their phone number and temporary password from your own phone. It works for 7 days.

4 Their first sign-in

They sign in with their phone number, add their email and choose their own password. The temporary password then stops working.

5 Forgotten passwords

Admins > New password gives them a fresh temporary password. Send it the same way.

6 Remove access

Remove an admin who no longer needs access. They are signed out straight away.

7 Check the system

System shows whether the database is working, the version running, which regions are open, and admins who have not finished setting up. System activity lists every admin sign-in and change.

8 Help a region

Choose the region under Region. You see its pages as its Regional Secretary does, and can make changes for them. Each page you open, and anything you change or download, is recorded in that region's Activity with your name.

Good to know

- Open a region only to help it. Its Regional Secretary can see in Activity every time you did.
- Open a region under System only when its Regional Secretary has an admin account.
- The temporary password in the server settings works only once: after your first sign-in, your own password replaces it.
